Moreover, a more favorable neurodevelopmental outcome was observed in group I than in group II. This study suggests that characteristic white matter injury in neonatal encephalopathy may be related to decreased calcium levels induced by rotavirus, and may have a better neurodevelopmental prognosis than other causes. Neonatal encephalopathy is a devastating cause of infant mortality and neurodevelopmental disability.^{1,2} Despite the therapeutic success of hypothermia, moderate to severely affected newborns continue to have a 30%-70% risk of death or disability.³⁻⁶ A key to improving outcome is the identification of early biomarkers of brain injury
